

Center Wiring Harness Highlights - CH-01

THE HIGHEST QUALITY WIRE

A wiring harness is only as good as its wire. That's why we use only the highest quality wire available with a cross-linked polyethylene jacket. This wire has a thin wall, and is resistant to abrasion, moisture, grease, oil, gasoline and most solvents. Rated to minimum of 257 F (125 C). This is high performance wire for a high performance application.

ALL NEW CONNECTORS, ALL NEW TERMINALS – SUPERIOR CONNECTIONS

Our wiring harnesses are made with original style, brand new connectors, terminals and boots throughout. In addition, all connections are crimped, and then soldered for maximum reliability and corrosion protection. High quality connections are the key to performance.

UPGRADED WIRE CURRENT CARRYING CAPACITY

This harness features upgraded wire sizes to reduce the wire overheating the OEM

harnesses are prone to. The alternator leads are upsized from 18 to 16 gauge, and the common ground lead is upsized from 16 to 14 gauge. These upgrades add low resistance conductor properties to the primary circuits in this harness.
